PENJELASAN TEKNIS

TECHNICAL NOTES

1. **Lahan sawah** adalah lahan pertanian yang berpetak-petak dan dibatasi oleh pemotongan (galengan), saluran untuk menahan/menyalurkan air, yang biasanya ditanami padi sawah tanpa memandang dari mana diperoleh atau status lahan tersebut. Lahan yang dimaksud termasuk lahan yang terdaftar di Pajak Bumi Bangunan, luran Pembangunan Daerah, lahan bengkok, lahan serobotan, lahan rawa yang ditanami padi dan lahan bekas tanaman tahunan yang telah dijadikan sawah, baik yang ditanami padi, palawija atau tanaman semusim lainnya.
2. **Data pokok tanaman pangan** yang dikumpulkan adalah luas panen dan produktivitas (hasil per hektar). Produksi tanaman pangan merupakan hasil perkalian antara luas panen dengan produktivitas. Pengumpulan data luas panen dilakukan setiap bulan dengan pendekatan area kecamatan di seluruh wilayah Indonesia. Pengumpulan data produktivitas dilakukan melalui pengukuran langsung pada plot ubinan berukuran $2\frac{1}{2}$ m x $2\frac{1}{2}$ m. Pengumpulan data produktivitas dilakukan setiap subround (empat bulanan) pada waktu panen petani.
3. Data produksi padi dan palawija yang disajikan adalah dalam kualitas: gabah kering giling (padi), pipilan kering
1. *Wetland* is agricultural land that separated by small dykes to resist water, where the main crop is usually wetland paddy without considering where it is got from or the status of the land. It includes the land that is registered at land income tax office, regional development contribution, 'bengkok' land, illegal ownership, swamps for rice cultivation, and annual crop land mark that has been used as rice field, which are both planted with paddy, secondary crops or the other seasonal crops.
2. *The main food crops data collected consists of harvested area and productivity (yield per hectare). Food crops production is generated by harvested area multiplied by productivity. The harvested area data is collected every month using sub district area approach in all sub district in Indonesia. The productivity data collection is conducted by a direct measurement in $2\frac{1}{2}m \times 2\frac{1}{2}m$ crop cutting plot. The productivity measurement is conducted in every subround (four monthly) at the time when farmers are harvesting their crops.*
3. *Production of paddy and secondary crops data are presented in the form of: dry unhusked rice (paddy), dry*

- (jagung), biji kering (kedelai dan kacang tanah), dan umbi basah (ubi kayu dan ubi jalar).
